This AOS product reliability report summarizes the qualification results for AOZ1281DI in DFN2x2_8L package. Accelerated environmental tests are performed on a specific sample size and samples are electrically tested before and after each time point. Review of final electrical test results confirm that AOZ1281DI pass the AOS quality and reliability requirements. The released products will be categorized by its process family and routinely monitored for continuous improvement of product quality.

II. Reliability Evaluation

FIT rate (per billion): 50.97

MTTF = 2240 years

The presentation of FIT rate for the individual product reliability is restricted by the actual burn-in sample size. Failure Rate Determination is based on JEDEC Standard JESD 85. FIT means one failure per billion hours.

Failure Rate = $\text{Chi}^2 \times 10^9 / [2 (N) (H) (Af)] = 50.97$

MTTF = $10^9 / \text{FIT} = 2240$ years

Chi² = Chi Squared Distribution, determined by the number of failures and confidence interval

N = Total Number of units from burn-in tests

H = Duration of burn-in testing

Af = Acceleration Factor from Test to Use Conditions ($E_a = 0.7\text{eV}$ and $T_{use} = 55^{\circ}\text{C}$)

Acceleration Factor **[Af]** = $\text{Exp} [E_a / k (1/T_J u - 1/T_J s)]$

Acceleration Factor ratio list:

	55 deg C	70 deg C	85 deg C	100 deg C	115 deg C	125 deg C
Af	77	26	9.8	3.9	1.7	1

T_{J s} = Stressed junction temperature in degree (Kelvin), $K = C + 273.16$

T_{J u} = The use junction temperature in degree (Kelvin), $K = C + 273.16$

k = Boltzmann's constant, $8.617164 \times 10^{-5}\text{eV} / K$

III. ESD and Latch Up Test Results
