The AOS product reliability report summarizes the qualification results for AOZ13937DI-01 in DFN3x3-12L package. Accelerated environmental tests are performed on a specific sample size, samples are electrically tested before and after each stress time point. Review of final electrical test results confirm that AOZ13937DI-01 pass the AOS quality and reliability requirements. The released products will be categorized by its process family and routinely monitored for continuous improvement of product quality.

II. Reliability Evaluation

The presentation of FIT rate for the individual product reliability is restricted by the actual burn-in sample size of the product technology. Failure Rate Determination is based on JEDEC Standard JESD 85.

FIT rate (failures per billion device hours): 0.460

MTTF = 2,174.7 million hrs

The failure rate (λ) is calculated as follows:

$$\lambda = \chi^2[CL, (2f+2)] / 2 \times [1 / (SS \times t \times AF)]; \text{ [equation 1]} \quad \text{where} \quad \begin{array}{l} CL = \% \text{ of confidence level} \\ f = \text{number of failure} \\ SS = \text{sample size} \\ t = \text{stress time} \end{array}$$

Looking up the $\chi^2/2$ table for zero failure (burn-in) with 60% confidence, the value of $\chi^2[CL, (2f+2)] / 2$ is 0.92.

The Acceleration Factor (AF) is calculated from the following formula (both temperature and voltage acceleration factors are used in the final acceleration factor calculation) :

$AF = AF_T \times AF_V = \exp[(E_a/k) \times (1/T_o - 1/T_s)] \times \exp[\beta (V_s - V_o)]$ where

E_a = activation energy
 k = Boltzmann constant
 T_o = operating T_J
 T_s = stress T_J
 V_s = stress voltage
 V_o = operating voltage
 β = voltage acceleration coefficient

Assuming typical operating environment, $V_o = 25V$, $T_o = 55^\circ C$, $E_a = 0.7eV$, $V_{s(DriverIC)} = 28V$, $V_{s(MOSFET)} = 30V$, $T_s = 150^\circ C$, $\beta = 0.5$ (silicon defect)

$$AF(DriverIC) = \exp\left[\left(\frac{0.7}{8.617E-5}\right) \cdot \left(\frac{1}{273+55} - \frac{1}{273+150}\right)\right] \cdot \exp[0.5 \cdot (28V - 25V)]$$

$$AF(MOSFET) = \exp\left[\left(\frac{0.7}{8.617E-5}\right) \cdot \left(\frac{1}{273+55} - \frac{1}{273+150}\right)\right] \cdot \exp[0.5 \cdot (30V - 25V)]$$

Substituting the values in equation 1, we have $\lambda = 2 \cdot \lambda(MOSFET) + \lambda(DriverIC) =$

$$0.92 \cdot \frac{2}{Sample\ Size \cdot Stress\ Duration \cdot AF(MOSFET)} + \frac{1}{sample\ Size \cdot Stress\ Duration \cdot AF(DriverIC)} hr^{-1}$$

$\lambda = 0.460 \cdot 10^{-9} hr^{-1}$ or 0.460 FIT; MTTF = $(1/\lambda) = 2,174.7$ million hrs = 248,251 years

The calculation shows failure rate is 0.460 FIT, MTTF is 2,174.7 million hours under typical operating conditions.
