The AOS product reliability report summarizes the qualification results for AOZ15953DI-01 in DFN4x4-16L package. Accelerated environmental tests are performed on a specific sample size, samples are electrically tested before and after each stress time point. Review of final electrical test results confirm that AOZ15953DI-01 pass the AOS quality and reliability requirements. The released products will be categorized by its process family and routinely monitored for continuous improvement of product quality.

II. Reliability Evaluation

The presentation of FIT rate for the individual product reliability is restricted by the actual burn-in sample size of the product technology. Failure Rate Determination is based on JEDEC Standard JESD 85.

FIT rate (failures per billion device hours): 0.460

MTTF = 2,174.7 million hrs

The failure rate (λ) is calculated as follows:

$$\lambda = \chi^2[\text{CL}, (2f+2)] / 2 \times [1 / (\text{SS} \times t \times \text{AF})]; \text{ [equation 1]}$$

where

CL = % of confidence level

f = number of failure

SS = sample size

t = stress time

Looking up the $\chi^2 / 2$ table for zero failure (burn-in) with 60% confidence, the value of $\chi^2[\text{CL}, (2f+2)] / 2$ is 0.92.

The Acceleration Factor (AF) is calculated from the following formula (both temperature and voltage acceleration factors are used in the final acceleration factor calculation) :

$AF = AF_T \times AF_V = \exp[(E_a/k) \times (1/T_0 - 1/T_s)] \times \exp[\beta (V_s - V_0)]$ where

E_a = activation energy

k = Boltzmann constant

T_0 = operating T_J

T_s = stress T_J

V_s = stress voltage

V_0 = operating voltage

β = voltage acceleration coefficient

Assuming typical operating environment, $V_0 = 25V$, $T_0 = 55^\circ C$, $E_a = 0.7eV$, $V_{s(DriverIC)} = 28V$, $V_{s(MOSFET)} = 30V$, $T_s = 150^\circ C$, $\beta = 0.5$ (silicon defect)

$$AF(DriverIC) = \exp\left[\left(\frac{0.7}{8.617E-5}\right) \cdot \left(\frac{1}{273+55} - \frac{1}{273+150}\right)\right] \cdot \exp[0.5 \cdot (28V - 25V)]$$

$$AF(MOSFET) = \exp\left[\left(\frac{0.7}{8.617E-5}\right) \cdot \left(\frac{1}{273+55} - \frac{1}{273+150}\right)\right] \cdot \exp[0.5 \cdot (30V - 25V)]$$

Substituting the values in equation 1, we have $\lambda = 2 \cdot \lambda(MOSFET) + \lambda(DriverIC) =$

$$0.92 \cdot \frac{2}{Sample\ Size \cdot Stress\ Duration \cdot AF(MOSFET)} + \frac{1}{sample\ Size \cdot Stress\ Duration \cdot AF(DriverIC)} hr^{-1}$$

$\lambda = 0.460 \cdot 10^{-9} hr^{-1}$ or 0.460 FIT; MTTF = $(1/\lambda) = 2,174.7$ million hrs = 248,251 years

The calculation shows failure rate is 0.460 FIT, MTTF is 2,174.7 million hours under typical operating conditions.
